Guidelines of Final Year Project

Updates：Sep 2024

I. Parts of the Final Year Project

1.1 Ten major parts of final year project：

1. Title page
2. Abstract
3. Table of content, list of tables, list of figures
4. Introduction
5. Content
6. Conclusion
7. References
8. Appendix (Chart or data information, etc.)
9. Resume
10. Acknowledgements

1.2 Length of Final Year Project：

Student should use English to write final year project. Minimum word requirement is 20,000, or 20 A4 pages long in 1.5 spacing with a 12 point Times New Romans font, not counting title page, table of content page, list of table page, list of figures page, bibliography, or appendices.

1.3 Font Size and Line Spacing：

Projects should be printed using 12 point in Times New Roman. Lines should be 1.5 spaced.

1.4 Submission of Final Year Project (For Defense Only)：

Students should submit final year project on or before the deadline. Please follow faculty submission method:

- Electronic Copy

Please submit electronic copy in PDF format to supervisor

1.5 Formal Submission of Final Year Project (After Defense)

Students should submit the final year project in PDF format.

The requirements are as following:

(1) Size of paper：A4

(2) PDF format

(3) Cover page as “Appendix I”

1.6 Language of Final Year Project

The report and the oral defense must use in English.

II. Methodology

2.1 Writing method of final year project

1. Abstract

   This is a summary of the report. It must be less than a page. It should give enough information to allow a potential reader to decide whether or not the report will be of interest to them. It should briefly describe the main ideas of the report, including the aims and conclusions. It should be both self-contained and self-explanatory, and it should not say anything not mentioned in the rest of the report (for this reason it is usually written last).

2. Introduction

   A good introduction should tell the reader what the project is about without assuming special knowledge and without introducing any specific material that might obscure the overview. It should anticipate and combine main points described in more detail in the rest of the project report. Normally it should include such things as:

   - the aim(s) or goal(s) of the project;
   - the scope of the project;
   - the approach used in carrying out the project; and
   - assumptions on which the work is based.

3. Content

   (1) It consists of main body of final year project, including

background, specification and design, results of experiment, data analysis and conclusion.

(2) The main points of the final year project in this section should be fully demonstrated, including both theoretical and practical parts.

4. Conclusion

The Conclusions section should be a summary of the aims of project and a restatement of its main results, i.e. what has been learnt and what it has achieved. An effective set of conclusions should not introduce new material. Instead it should briefly draw out, summarize, combine and reiterate the main points that have been made in the body of the project report and present opinions based on them. The Conclusions section marks the end of the project report proper. Be honest and objective in your conclusions.

5. References

you should relate your work to that of other people. Other work explicitly cited should be listed in the Reference section and referred to in the text using some kind of key. It is important that you give proper credit to all work that is not strictly your own and that you do not violate copyright restrictions.

References in the Reference section should be listed in order of author's surname(s) alphabetically, and should give sufficient and accurate publication details. For example,

[Key1] E.J. Chikofsky and J.H. Cross. Reverse Engineering and Design Recovery: A Taxonomy. IEEE Software, 7(1):13-17, 1990.

[Key2] C.J. Date, An Introduction to Database Systems, 7th edition, Addison-Wesley, 2000,ISBN 0-201-38590-2.are acceptable bibliographic entries.

There are various conventions for creating bibliographic keys.

For example, you can quote the name of the author and the year of publication, e.g. A more detailed description can be found in [Borland 89].

There are several other variations. For example, some authors prefer to use only the first three or four letters of the name, e.g. [Borl89] or just to number the references sequentially, e.g. [3]. It can be helpful to the reader if, for books and other long publications, you specify the page number too, e.g. [Borland 89 p22], or just number the references.

6. Appendix (Chart or data information, etc.)

   Appendices are repositories for material which you want to include in the report, but which would seriously obstruct the flow of ideas if put anywhere in the main body. In computing project reports it is normal to include a printout of (the final version of) the source code of the system in an appendix. (If you have carried out the project for a commercial organization make sure that you have their permission to do this.) Other documents you have written, such as user manuals, technical manuals or formal specifications should go here too.

   Appendices should be headed by letters in alphabetical order, i.e. Appendix A, Appendix B, etc.

7. Resume

   To mainly introduce yourself such as, education background and work experience, etc. It makes people to know the author clearly.

8. Acknowledgements

   This optional section should be used to record indebtedness for the use of facilities or help from particular sources. You should mention any organizations who have helped you while you have been carrying out the project.
